1 Safety Information

For your own safety and for the safety of others, always heed the safety information given here. The safety information indicates possible hazards and provides information about how you can avoid hazardous situations.

The following symbols are used in this manual.

Caution, indicates hazards and sources of error

Gives information

.

Hazard, general or specific

Danger of electric shock

1.1 General

The NETLink[®] USB Compact is only used as part of a complete system.

• The operator of a machine system is responsible for observing all safety and accident prevention regulations applicable to the application in question.

During configuration, safety and accident prevention rules specific to the application must be observed.

Emergency OFF facilities according to EN 60204 / IEC 204 must remain active in all modes of the machine system. The system must not enter an undefined restart.

Faults occurring in the machine system that can cause damage to property or injury to persons must be prevented by additional external equipment. Such equipment must also ensure entry into a safe state in the event of a fault. Such equipment includes electromechanical safety buttons, mechanical interlocks, etc. (see EN 954-1, risk assessment).

Never execute or initiate safety-related functions using an operator terminal.

Only authorized persons must have access to the modules!

During configuration, safety and accident prevention rules specific to the application must be observed.

Make sure in the software that uncontrolled restarts cannot occur.

1.2 Restriction of access

The modules are open components and must only be installed in a PG or PC. Because the components on the boards are very sensitive to electrostatic discharges, access to the closed PG/PC housing is only permitted using the appropriate tools or keys and only to instructed and authorized persons.

1.3 Information for the user

This manual is addressed to anyone wishing to configure, use, or install the NETLink[®] USB Compact.

The manual tells the user how to operate the NETLink[®] USB Compact and explains the signaling functions. It provides the installing technician with all the necessary data.

The NETLink[®] USB Compact is exclusively for use with a S7-200 and S7-300/S7-400 programmable controller from Siemens.

The NETLink[®] USB Compact is for use within a complete system only. For that reason, the configuring engineer, user, and installing technician must observe the standards, safety and accident prevention rules applicable in the particular application. The operator of the automation system is responsible for observing these rules.

1.4 Use as intended

The NETLink[®] USB Compact must only be used as a communication and signaling system as described in the manual.

1.5 Avoiding use not as intended!

Safety-related functions must not be controlled via the NETLink[®] USB Compact alone. Make sure in the software that uncontrolled restarts cannot occur.

2 System Overview

2.1 Application and function description

The NETLink[®] USB Compact is a gateway between USB and an MPI, PPI, or PROFIBUS.

With one USB connection (12 Mbps full speed or 480 Mbps high speed), up to 32 MPI/PROFIBUS connections (9.6 kbps to 12 Mbps) can be used simultaneously.

At both the USB and the field bus ends, the baudrate used can be determined automatically (autodetect or autobaud)

The NETLink[®] USB Compact draws its 5-volt power supply from the USB interface of the PG/PCs.

The NETLink[®] USB Compact has the shape of a PROFIBUS connector with a PG female connector and it is plugged directly into the MPI/PPI/PROFIBUS interface of the automation system. Because it is active, no spur line is created that could interfere with the bus. The USB end of the NETLink[®] USB Compact is electrically isolated from the MPI/PPI/PROFIBUS.

The NETLink[®] USB Compact is connected to the PG/PC by the 3m long USB 2.0 cable that is permanently attached to the housing. The USB cable can be extended, for example, using a self-powered USB hub.

The use of drivers makes it possible to use the NETLink[®] USB Compact at the PC end as a

- Programming adapter or
- Operator control and monitoring unit

The transmission rates of USB 1.1 and USB 2.0 are supported.

Before you start installation work, all system components must be disconnected from their power source.

3 Installation and Mounting

Installation must be effected in compliance with VDE 0100 / IEC 364. The NETLink[®] USB Compact has degree of protection IP20. Please ensure a maximum ambient temperature of 60 °C for reliable operation.

The NETLink[®] USB Compact is plugged directly into the SUB D female connector of the PROFIBUS station instead of the standard PROFIBUS device connector. It is fixed using the permanently integrated hexagon-head housing screws and therefore makes permanent contact.

Further bus nodes for diagnostic devices can be connected to the integrated PG female connector.

Only the USB communication cable is permanently mounted on NETLink[®] USB Compact housing. No further outlets, for example, PROFIBUS cable, can be connected to the device. Therefore no termination is possible on the connector housing and the "ON/OFF" switch for this is not been incorporated.

3.1 Connections

The NETLink[®] USB Compact has the following connections:

- USB 2.0 cable with standard A connectors for connecting the device to commercially available PG/PCs or hubs.
- Bus connector with PG female connector This enables further bus nodes to be plugged in. The NETLink[®] USB Compact is an 'active cable.' This means there is no spur line, which avoids interference with high baud rates.

3.2 LED displays

For display of the operating state, the NETLink[®] USB Compact has two multi-colored LEDs. These are located on the front of the housing behind a white inspection window.

LED status for operating status	Power LED (blue)	Bus LED (orange)	Active LED (green)	Bus LED (red)
Ready for operation	ON			
Try to log on to the MPI/PPI/PROFIBUS	ON	BLINK		
Actively logged on to the MPI/PPI/PROFIBUS	ON		ON	
Data exchange with a programmable controller	ON		BLINK	
Transferring firmware update	ON			BLINK

3.3 Items supplied

The scope of supply of the NETLink[®] USB Compact includes:

- NETLink[®] USB Compact ready to run
- CD with NETLink[®]-S7-NET driver, additional info
- Manual (German/English)

3.4 Accessories

3.4.1 Manuals

Manual, German Manual, English 900-882-MPI21/de 900-882-MPI21/en

3.4.2 Software

S7/S5 OPC server with USB dongle

800-880-OPC20

4 Installation of the driver software

With installation of the NETLink[®]-S7-NET driver for the NETLink[®] USB Compact, it is easy to access controllers with an MPI, PPI, or PROFIBUS interface from the PC via USB.

4.1 Introduction

The NETLink[®]-S7-NET driver is inserted in the PG/PC interface of an existing Simatic application and can then be used from most Simatic engineering tools (STEP7, ProTool, WinCC, etc.).

Access is possible to any controllers of the Simatic S7-200, S7-300, or S7-400 series. To connect a Simatic S7-200, S7-300, or S7-400 controller, the communication adapter NETLink[®] USB Compact and a corresponding MPI/PPI/PROFIBUS cable is required.

4.2 System requirements

A PC with a 32-bit Windows operating system is required to operate the NETLink[®]-S7-NET driver at the PG end. The Windows 2000, Windows XP, and Windows Vista operating systems can be used.

A further requirement is the existence of a Simatic engineering tool, such as STEP7, Version 5.1 and higher or STEP7-Micro/Win Version 4.0 and higher, which ensures that the PG/PC interface is installed on the computer.

Installation under Windows 98/ME/NT is possible but is not supported by the technical support team of Systeme Helmholz GmbH. Please pay attention to the requirements of the Simatic package used.

The PG/PC used must contain at least one (internal or external) functioning USB interface. The best performance is achieved using an interface complying with USB 2.0 (high speed at 480 Mbps). USB interfaces that only achieve full speed (12 Mbps) are also possible, but this slows down status operation.

4.3 Running the installation setup

After you have inserted the installation CD, user guidance starts automatically, allowing the user to start the setup routine of the NETLink[®]-S7[®]-NET driver.

If the user guidance does not start automatically, the setup file can be launched manually in directory '*CD drive*:*Driver*\.'

If necessary, you can download the latest NETLink[®]-S7-NET driver from our homepage (http://www.helmholz.com).

Please note that for installation you have to log on as an administrator under the 32-bit Windows operating systems Windows 2000[®] and Windows XP[®] because the setup program has to make entries in the Windows registry.

Administration rights are required for installation.

4.3.1 Adding the interface to the PG/PC interface

After initial installation, the new interface parameter set '*NETLink*[®]-*S7-NET USB'* has to be set up. Administrator rights are necessary for this.

After you have started '*Set PG/PC Interface*' in the Control Panel, click the '*Select...*' button there.

Set PG/PC Interface	×
Access Path LLDP	,
Access Point of the Application: S70NLINE (STEP 7)> PC Adapter(Auto (Standard for STEP 7)	0)
Interface Parameter Assignment Used: PC Adapter(Auto)	Properties
Adapter(Auto)	Copy Delete
Add/Hemove:	Cancel Help

This opens the 'Install/uninstall interface' dialog box.

Install/Remove Interfaces	×
Selection: Module NETLink-S7-NET US NETLink-S7-NET US NETLink-S7-NET lite PC Adapter PC COM-Port (USS) PC/PPI cable	Installed: Module PLCSIM V5.x TCP/IP -> Intel(R) 82566DM Gigab TCP/IP -> NdisWanIp TCP/IP -> NdisWanIp TCP/IP -> TAP-Win32 Adapter V8 TS Adapter TS Adapter IE
NETLink-S7-NET PRO for PPI/MPI/PROFIBUS networks via TCI	

After you have selected the entry '*NETLink*[®]-*S7-NET USB*' from the left-hand list, click the '*Install*' button.

Now you have answered the query, '*NETLink*[®]-*S7-NET USB*' will appear in the right-hand list with the interfaces already installed.

IIII NETLink USB(PPI)	Сору		
PC Adapter(Auto)	Delete		
(Assigning User Parameters to a NETLink USB for a MPI network)			
Interfaces			
Add/Remove:	Select		
OK	Cancel Help		

All relevant settings of a NETLink[®]-S7-NET driver can be made via the *'Properties'* access field. With the button *'Diagnostics...,'* it is possible to show the nodes connected to the bus and the parameters the bus is working with. These fields are explained in Section 5.

4.4 Installation of the USB driver

If this is the first time a NETLink[®] USB Compact is being connected to the PC, the operating system will try to install a suitable driver. The driver is a sort of interface between the USB interface and the operating system (Windows) and has nothing to do with the actual application (NETLink[®]-S7-NET).

This initialization can take some time and goes through the following steps:

• The operating system starts an installation wizard that performs the installation, which is largely automatic. Here it is necessary to specify that the source for the USB driver should not be ascertained automatically.

Found New Hardware Wizard		
	Welcome to the Found New Hardware Wizard	
	This wizard helps you install software for:	
	NETLink USB	
	If your hardware came with an installation CD or floppy disk, insert it now.	
	What do you want the wizard to do?	
	O Install the software automatically (Recommended)	
	Install from a list or specific location (Advanced)	
	Click Next to continue.	
	< <u>B</u> ack <u>Next</u> > Cancel	

• The next step is a prompt to specify the location of the driver.

It is generally enough to set a checkmark next to 'Search removable media...' and then to click the 'Next' button.

Found New Hardware Wizard
Please choose your search and installation options.
Search for the best driver in these locations.
Use the check boxes below to limit or expand the default search, which includes local paths and removable media. The best driver found will be installed.
Search removable media (floppy, CD-ROM)
Include this location in the search;
BIowse
C Don't search. I will choose the driver to install.
Choose this option to select the device driver from a list. Windows does not guarantee that the driver you choose will be the best match for your hardware.
< <u>B</u> ack <u>N</u> ext > Cancel

• The system now searches for the driver.

Found New Hardware Wizard		
Please wait while the wizard searches		2
NETLink USB		
	3	
	Cancel	_

• If the NETLink-S7-NET CD is inserted in a local drive, installation should start after a short time.

Found New Hardware Wizard			
Please wait while the wizard installs the software			
NETLink USB			
م الح			
	< <u>B</u> ack <u>N</u> ext > Cancel		

• After successful installation, the operation is completed by clicking the *'Finish'* button.

Found New Hardware Wizard		
	Completing the Found New Hardware Wizard The wizard has finished installing the software for:	
	NETLink USB	
	Click Finish to close the wizard.	
	< Back Finish Cancel	

The NETLink[®] USB Compact has been successfully installed and can now be used.

As long as the NETLink[®] USB Compact is always operated on the same USB interface in your PG/PC, the driver files of the operating system are not queried again.

5 Configuration via the NETLink-S7-NET Driver

Once a NETLink[®] USB has been selected in the '*Set PG/PC Interface*' window, it is possible to specify this access path more precisely with the '*Properties...*' button.

With the functionality behind the button '*Diagnostics...,*' which is visible when a NETLink[®] USB is selected, it is possible to read the bus configuration and scan connected nodes.

The following properties of the access NETLink[®] USB are available:

• Bus settings

Here it is possible to state the bus configuration (e.g. station address) with which the NETLink[®] USB Compact will enter the bus system (Section 5.1).

• Options

Here it is possible to change the language of the NETLink-S7-NET driver and to read out the version information of the driver (Section 5.2).

Two functionalities are implemented for diagnostics at the connected bus:

• Bus members

a list of all active and passive nodes connected to the bus will be displayed. By request the order numbers (MLFBs) will be displayed also if this functionality is available by the nodes (Section 5.4.1).

• Bus parameters If possible, a list of all available bus parameters will be displayed (Section 5.4.2).

5.1 Bus settings

The NETLink[®] USB Compact can be operated on three different bus systems: MPI, PPI, and PROFIBUS.

From the NETLink[®] USB Compact user's viewpoint, the three bus systems only differentiates by the transmission rates that can be selected and the additional options which are explained here.

The bus configuration is passed to the NETLink[®] USB Compact during the runtime of the NETLink-S7-NET driver and is not stored in the device.

It is possible to use the NETLink[®] USB Compact without specifying bus-related information. The NETLink[®] USB Compact then automatically ascertains the baud rate and the bus parameters, and can be operated on different programmable controllers with different transmission rates without switching over the NETLink-S7-NET driver.

5.1.1 MPI

The MPI configuration contains station and network-related settings.

Properties - NETLink USB(MPI)	? >
Bus parameter Options	
Station parameters	
Automatic transmission rate of	letection
Address:	0
Timeout (ms):	10000
Network parameters	
Transmission rate:	187,5 Kbps 📃
Highest Station Address:	31
ОК	Cancel Help

The most important setting concerning bus configuration is assignment of the station address. This refers to the address the NET-Link[®] USB Compact will have on the bus when it goes online.

The station address can have any value from '0' and '126' if the selected address is lower than or equal to the highest station address (HSA).

Example: HSA = 31

Any value between '0' and '31' can be specified for the station address if this address does not yet exist on the bus.

The local timeout of the NETLink-S7-NET driver can be parameterized in the station-related settings. If the driver does not receive a response to a request within the set timeout, a communication error is signaled to the Simatic application.

The network settings can be adapted manually if the checkmark next to "*Automatic Baud Rate Detection*" is removed. This is usually only necessary if the NETLink[®] USB Compact fails to sign onto the bus system automatically (can happen with passive bus nodes). Some older Siemens CPUs do not support the auto baud function on the MPI. PPI systems do not usually support this function either. In such cases, the network-related parameters should be adapted manually.

Properties - NETLink USB(MPI)		<u>?</u> ×

Timeout (ms):	10000	
Network parameters		
Transmission rate:	187,5 Kbps	•
Highest Station Address:	31	•
OK	Cancel	Help

The transmission speed and the HSA of the PLC being addressed must be known and identical to all connected bus nodes.

It is also possible that the auto baud function may not function reliably at transmission rates slower than or equal to 19.2 Kbps or with increased use of communication via global data exchange, because the relevant frame is transmitted more irregularly by the CPUs. In such cases it may be advantageous to assign the bus parameters manually.

5.1.2 **PROFIBUS** configuration

Basically, the same applies to PROFIBUS configuration as to MPI configuration. However, the network-related parameters are more extensive.

In addition to the parameters transmission rate and highest station address mentioned in Section 5.1.1, PROFIBUS also has parameter field for selecting the bus profile and bus parameters.

If the NETLink[®] USB Compact is the only active station on the PROFIBUS, it operates in so-called single-master mode, i.e. it generates the token cycle with the set bus parameters.

If the bus speed on the PROFIBUS is set to a value less than 187.5 Kbps, please remember that it may take up to half a minute for the bus parameters to be recognized.

In this case, the timeout value should be increased correspondingly.

- Unlike the MPI bus profile, the bus parameters for PROFIBUS are not constant and change with the type and number of PROFIBUS stations used.
- Always set the PROFIBUS parameters that are set in the currently used programmable controller (see current STEP7 project).

In order to simplify these procedures, it makes sense to use of the auto baud function under PROFIBUS.

The bus parameters are then calculated automatically.

In addition to the parameters transmission rate and highest station address mentioned in Section 5.1.1, PROFIBUS also has a parameter field for selecting the bus profile and bus parameters:

According to current knowledge, all S7-200 CPUs of the product line 22x should be able to communicate with '*Advanced PPI*.' It is recommended to use '*Advanced PPI*' if possible.

5.2 Options of the driver

Under the options of the NETLink-S7-NET driver, it is possible to set the language of the output and help texts of the driver.

Normally the baud rate cannot be detected automatically at PPI systems. It is also possible to read out the version numbers of the driver files used.

5.2.1 Language setting of the display elements

The languages German and English are currently available.

After switching over the language, the setting window must be opened again to apply the changes.

5.2.2 Version information

The names and version number of all driver files are listed here.

If support is needed, this data is used to obtain information about the components used quickly and effectively.

5.3 Diagnostics

For rudimentary diagnostics of the connected bus two sub functions are available:

- Display bus nodes
- Display bus parameters

Before the diagnostics functionality is used, a valid station must be created and a plausible bus configuration set.

5.3.1 Bus members

A list of all available nodes at the bus will be generated by clicking the button *'Read.'*

With activating the option '*Read MLFB number*' the order numbers of all devices supporting this function will be displayed too.

The possibility to detect all connected nodes depends on the parameterization of the PG/PC Interface.

It is recommended to enable auto baud functionality at MPI and PROFIBUS.

6 Troubleshooting

The points described here show some typical errors that can occur in day-to-day work with the NETLink[®] USB Compact.

If any condition during operation is not described here and this manual does not provide any information on how to remedy it, the support of Systeme Helmholz GmbH is available to help you.

Q: Although I have already operated a NETLink USB Compact on my PC, I am prompted to install a USB driver if I want to use another NETLink USB or another USB interface of my PC.

A: USB devices are usually equipped with a serial number. This is used to identify devices that are already known.

If you use two USB devices of the same type, two instances of the driver will be installed on your computer for this device type. You will find the USB driver on the CD supplied in directory '*CD directory:**Driver*'. You can also download it from our homepage at www.helmholz.de.

Q: During the usage of a NETLink USB Compact on an external hub or a separate USB card it comes to unexpected errors. Disconnecting and reconnecting the USB cable between NETLink USB and hub does not clear the situation.

A: Is e.g. the power supply of the hub too powerless for the NET-Link USB Compact, some of the hubs on the marked providing an error to the host system (the pc). This triggers a logical disconnection of the hub from the host – the host is not functioning anymore.

After a physically disconnect of the hub from the host and a reconnection to the host the hub should work again.

To solve the problem with the NETLink USB Compact use an external power supply for this device.

Q: The setting dialog boxes are not appearing in the Simatic Manager:

A: Please note that after initial installation the NETLink[®]-S7-NET driver must be added to the PG/PC interfaces.

Make sure you had administrator rights during installation. Reboot your PC after installation if prompted to do so.

You need at least version 5.1 of the Simatic Manager.

Q: When the connection to the PROFIBUS is plugged in, no online connection is possible.

A: If possible, use the autobaud functionality.

If this is not possible or not desired, check the timing parameters for the PROFIBUS in the STEP7 configuration. Enter the read values into the advanced bus parameter settings via the '*Bus parameters*' button. If on-line access is still not possible, set a higher '*Ttr*' (target rotation time) both in the NETLink USB Compact and on the CPU.

Q: The Starter program has problems accessing a Micromaster drive.

A: When you request a *'control priority'* for the Micromaster drive, please increase the Failure monitoring from 20ms to 200ms and the Application monitoring from 2000ms to 5000ms, so that the Starter software remains operable.

Q: If I set the NETLink[®] USB Compact to autobaud in the PG/PC interface and try to go online, the orange LED lights up briefly before a message appears telling me that the bus parameters cannot be determined.

A: Either the CPU used does not support the cyclic transmission of bus parameters (disabled via parameterization or function does not exist), or the CPU is so busy with general communication tasks that the lower-priority bus parameter frame is transmitted too in-frequently and cannot be detected by the NETLink[®] USB Compact. Please deactivate the autobaud functionality in the NETLink[®]-S7-NET driver (PG/PC interface) and set the correct baudrate and the correct profile manually.

Q: If I open multiple connections via the STEP7 driver, the link sometimes breaks off or error messages appear saying that it is not possible to establish a link.

A: For communication with S7-300 modules it may be necessary to parameterize the communication resources.

The user can influence the allocation of existing *'connection re-sources'* under object properties of the CPU in the hardware configuration.

Q: Once the configured PROFIBUS slaves have been added on my CPU, communication between NETLink[®] USB Compact and STEP7 becomes markedly slower.

A: The user can influence the allocation of *'cycle load due to communication* [%]' under object properties of the CPU in the hardware configuration. The default value is 20 %.

Q: What must I observe when calling your technical support?

A: Please have all relevant data of your system constellation with the connected stations and program modules at hand when you contact technical support at Systeme Helmholz GmbH.

7 Appendix

7.1 Technical data

Dimensions in mm (LxWxH)	64 x40 x 17
Weight	Approx. 110 g
Operating voltage / current con- sumption	5 V DC, 500 mA (USB) Automatically selected
USB port	USB 2.0 (high speed), downward compatible with USB 1.1
USB connector	USB A connector
USB transmission rate	12 Mbps (full speed) and 480 Mbps (high speed)
MPI/PPI/PROFIBUS interface	RS485, electrically isolated
MPI/PROFIBUS transmission rate (automatic detection)	9.6 Kbps; 19.2 kbps 45.45 kbps 93.75 kbps 187.5 kbps 500 kbps 1.5 Mbps 3 Mbps 6 Mbps 12 Mbps
MPI/PROFIBUS connection	SUB D connector, 9-way with PG- interface
MPI/PROFIBUS protocols	FDL protocol for MPI and PROFIBUS
Displays	2 LEDs, including 1 three-color LED, for general status information
Degree of protection	IP 20
Operating temperature	0 °C 60 °C
Storage and transportation tempera- ture	-25 °C to +75 °C
Relative humidity during operation	5 % to 85 % at 30 $^\circ\!\!\!\mathrm{C}$ (no condensation)
Relative humidity during storage	5 % to 93 % at 40 $^\circ\!$

7.2 Pin assignments

Connector	Signal	Meaning
1	-	Unused
2	GND	Ground
3	RxD / TxD-P	Receive / transmit data-P
4	RTS-AS	Transmit request from AS
5	DGND	Ground for bus termination
6	DVCC	5 V DC for bus termination
7	VCC	24 V DC (available only in the case of power supply via connector P1)!
8	RxD / TxD-N	Receive / transmit data-N
9	RTS-PG	Transmit request to AS

7.2.1 MPI/PPI/PROFIBUS interface pin assignments

7.2.2 Assignment of the USB interface

Connector	Signal	Meaning
1	VCC	5 V DC
2	D-	Data -
3	D+	Data +
4	GND	Ground

A shielded USB 2.0 cable is permanently connected to the NET-Link[®] USB Compact. It is three meters long and ends in a type-A USB connector.

As a rule, for USB, the cable length between two USB interfaces should not be longer than three meters. Minimization of the voltage drop in the cable is a decisive factor for smooth operation of the connected devices for a 5-volt power supply.

If larger distances have to be covered, the use of USB hubs is recommended.

8 Glossary

These are explanations of the most important technical terms and abbreviations from the manual.

- AdvancedThe extension of the PPI protocol of the S7-200 series, normally only compatible with CPUs of the S7-22x series and higher
- ASCII American Standard Code for Information Interchange describes a character set that includes the Latin alphabet in upper and lower case, the ten Arabic numerals, as well as some punctuation marks and control characters
- Autobaud Also called "auto sensing," is a function supporting automatic adjustment of the baud rates in a network
- Baudrate The speed set on a bus system
- Bit Binary digit describes the smallest digital information unit. Defines 0 or 1
- Bus Buses are connection systems for electronic components. For example, the MPI Bus is a connection medium for S7
- Byte A byte denotes a series of 8 bits that constitute a logical data entity
- Client A device that requests services. The requests are sent to a server, which returns the relevant answers to the client.
- Computer In this manual, this refers to the programmer (PG) or personal computer (PC).
- Firewall A service running on a server that blocks certain services/ports and prohibits unauthorized access
- Full speed: Definition of the interface speed to 12 Mbit/s
- Gap The Gap Update Factor specifies after how many token cycles the master checks whether an additional master is signaling its presence on the bus
- High speed Definition of the interface speed to 480 Mbit/s
- HMI Human-Machine Interface denotes the interface between the human operator and a system through which the operator can operate the system or intervene in the process
- HSA Highest station address that is polled
- Hub A mediation system to connect several segments. Can optional operate with its own power supply, to achieve longer distances via USB
- Host A computer system that provides services as an active or "smart" part for other connected client devices
- Interfaces General definition of interfaces, such as a network interface card that constitutes an Ethernet interface
- Low speed Definition of the interface speed to 1,5 Mbit/s
- Master Is and active station that is permitted to transmit data to and request data from other stations, when it holds the token
- MLFB 16-digit Siemens identification number
- MPI Multipoint Interface. Interface that is used for S7-300 and S7-400 systems and that supports baud rates up to 1.5 Mbps

OPC	Object Linking and Embedding for Process Control allows data transfer be- tween applications of different producers, for example, using the RFC1006 protocol
PG socket	The programming unit socket of the bus connector allows further bus nodes to be plugged in.
PPI	Point-to-point interface, interface with S7-200 systems with a maximum baud rate of 187.5 kbps
PROFIBUS	Process Field Bus is the protocol that is used mainly for automation, e.g. for the S7-300 and S7-400 systems with a maximum baud rate of 12 Mbps
Profinet	Standard for industrial Ethernet in automation.
Rack/Slot	Rack refers to the configured module rack (default: 0) and slot, to the slot for the module in question (default CPU: 2). The default configuration for an R/S is therefore $0/2$
Retry limit	Bus parameter that determines the number of attempts will be made to call a DP slave
SCADA	Supervisory Control and Data Acquisition. Generic term for a type of proc- ess visualization that includes monitoring, control, and data acquisition of automation systems, etc.
Server	A device that provides special services at the request of clients.
Single master	Only one master is connected to the system. The NETLink [®] family members WLAN, Switch, and PRO Compact can also act as single masters
Slave	A station that is only permitted to exchange data with the master if re- quested to do so by the latter.
Timeout	Defines a protocol instruction that is activated if a defined time has been exceeded
Token	Is a frame for permission to transmit in a network. It is passed from master to master
Tqui	Transmitter fall time (bit) is the time that is needed to restore the quiescent signal level on the signal line after transmitting data
TSAP	Transport Service Access Point. The TSAP corresponds to the layer 4 address that has to match crossed-over for a station and the communication partner to be reached. The remote TSAP of Station1 is equivalent to the local TSAP of Station2. Entry of any characters, e.g. numerals is possible
Tsdr	Protocol processing time of the responding station (station delay responder)
Tset	The setup time (bit) is the time that is allowed to elapse between transmit- ting and receiving telegrams
Tslot_Init	The slot time (bit) is the maximum time that a transmitter waits for a sta- tion it has addressed to respond
Ttr	Target rotation time (Bit) is the reference token time. This means teh refer- ence and actual token times are compared. This difference determines how much time is available to the master to transmit its own telegrams to the slaves
USB	Abbr. for Universal Serial Bus. Standard for a variety of of peripheral devices. They can be embedded at the system runtime (hot plugging)

USB 1.1	Specification, which defines the maximum data rate of 12 Mbit/s
USB 2.0	USB 1.1 successor specification with a higher date rate to 480 Mbit/s
USB Hub	See Hub
Wizard	A step by step startup help to simplify a driver installation for the user
